

ABSTRACT OF THE DISCLOSURE

A pelvis correction apparatus is disclosed, by which appropriate pelvis correction therapy is performed with application of sufficient pressing force at a predetermined angle to a patient by simple operation irrespective of therapist's skill. The apparatus includes a bed, pressing bars which moves from both sides of the bed toward a pelvis of the patient on the bed with a predetermined inclination angle, the pressing bars having pressing members on one ends, the pressing members brought into contact with the patient to convey pressing force to the pelvis, and a member for urging the movement of the pressing bars.
